Improving/Creating Green Roofs

- Description: Green roofs are a fantastic way to improve stormwater management, conserve energy, cut back on carbon emissions, and generally make urban spaces more pleasing. Nordenberg's outdoor area has a small "green space" that is mostly grass, but this could easily be converted into a student garden or at least a better and more pleasing area. Nordenberg is only one example of the many places students might endeavour to incorporate more green space into campus, whether they want to improve upon an existing space or create entirely new green roofs.
